

# Card Brand Mixup Attack: Bypassing the PIN in non-Visa cards by Using Them for Visa Transactions

David Basin   Ralf Sasse   **Jorge Toro**

ETH Zurich

*30th USENIX Security Symposium*  
August 2021

# Outline

1. Introduction

2. Attack and countermeasures

3. Conclusion

# EMV standard

- ▶ EMV is the protocol standard for **smartcard payments**
- ▶ Founded by **E**uropay, **M**astercard, and **V**isa,  
and later Amex, JCB, Discover, and UnionPay joined the consortium too
- ▶ **9+ billion** EMV cards in circulation worldwide

**VISA**

DISCOVER

# EMV security

## Cardholder protection

Low-value purchases do not require a PIN

High-value purchases **should** be protected by PIN

# EMV security

## Cardholder protection

Low-value purchases do not require a PIN

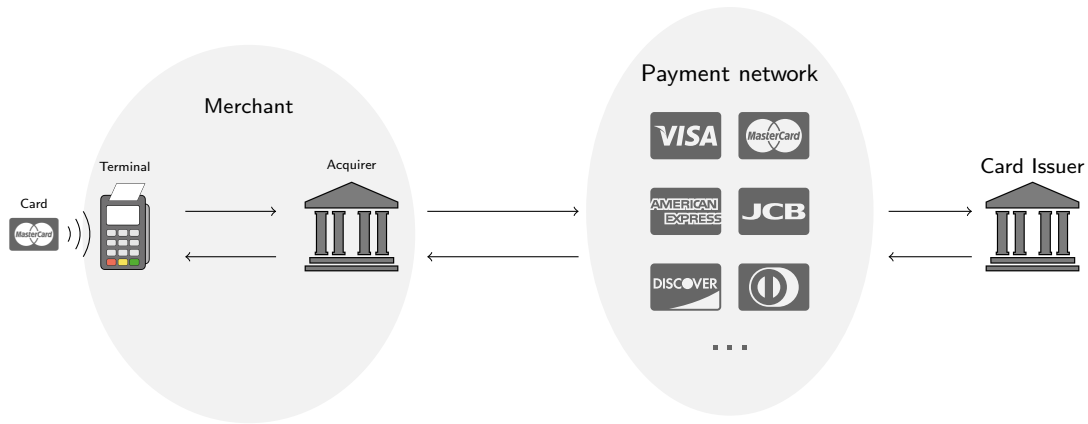

High-value purchases **should** be protected by PIN

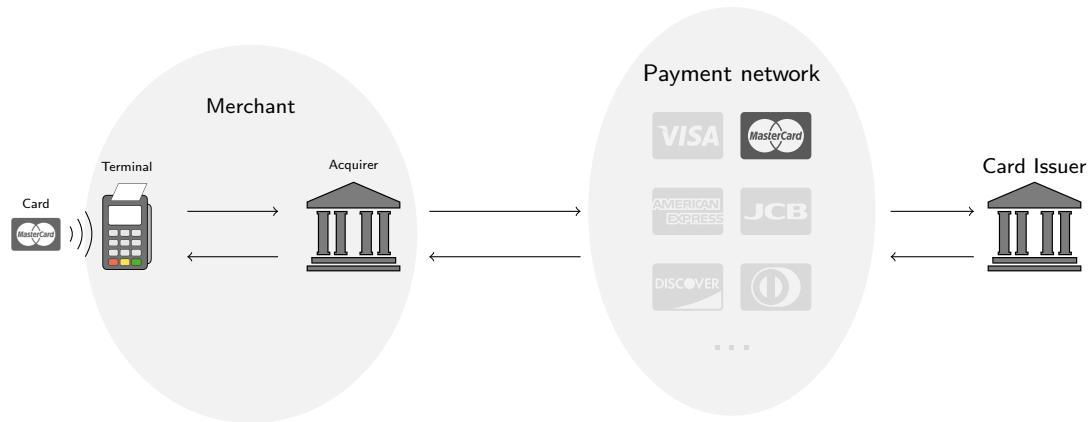

We'll show that they are **not**

# Online authorization and routing

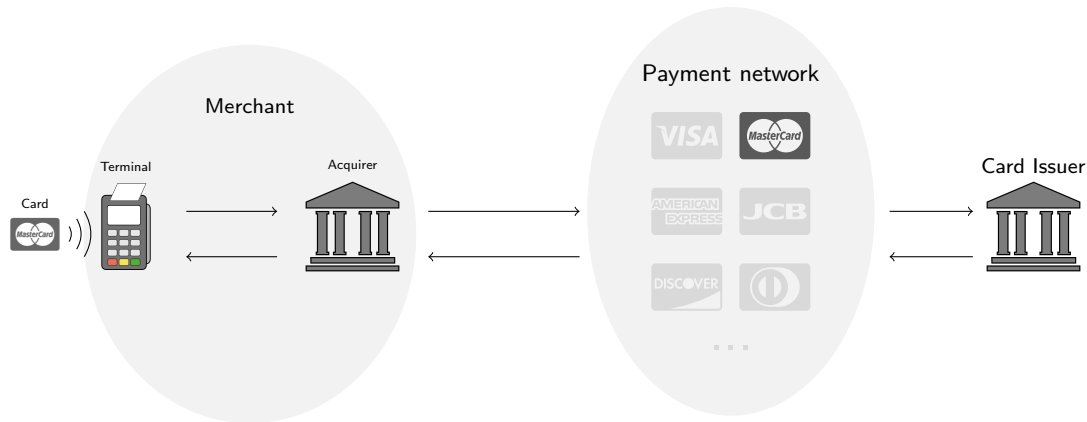

# Online authorization and routing

**What card data does the merchant use to determine the payment network?**

# Online authorization and routing

**What card data does the merchant use to determine the payment network?**

The *Application Identifier (AID)* or the *Primary Account Number (PAN)*?

# Online authorization and routing

**What card data does the merchant use to determine the payment network?**

The *Application Identifier (AID)* or the *Primary Account Number (PAN)*?

**Why multiple choices? Do they always indicate the same payment network?**

# Contributions

- ▶ **Extended our Tamarin model of EMV to account for different routing choices**
  - ▶ Develop an EMV model with PAN-based routing
  - ▶ Model permits transactions where merchant and issuer don't agree on the card brand

# Contributions

- ▶ **Extended our Tamarin model of EMV to account for different routing choices**
  - ▶ Develop an EMV model with PAN-based routing
  - ▶ Model permits transactions where merchant and issuer don't agree on the card brand
- ▶ **Identified the *card brand mixup* attack**
  - ▶ Attacker induces mismatch between the issuer and the merchant's views of the card brand
  - ▶ Leads to PIN bypass for non-Visa cards

# Contributions

- ▶ **Extended our Tamarin model of EMV to account for different routing choices**
  - ▶ Develop an EMV model with PAN-based routing
  - ▶ Model permits transactions where merchant and issuer don't agree on the card brand
- ▶ **Identified the *card brand mixup* attack**
  - ▶ Attacker induces mismatch between the issuer and the merchant's views of the card brand
  - ▶ Leads to PIN bypass for non-Visa cards
- ▶ **Mechanized the attack and showed it is effective and easy to carry out**
  - ▶ Bypassed the PIN for a transaction of over **USD 400** with a Maestro card

# Contributions

- ▶ **Extended our Tamarin model of EMV to account for different routing choices**
  - ▶ Develop an EMV model with PAN-based routing
  - ▶ Model permits transactions where merchant and issuer don't agree on the card brand
- ▶ **Identified the *card brand mixup* attack**
  - ▶ Attacker induces mismatch between the issuer and the merchant's views of the card brand
  - ▶ Leads to PIN bypass for non-Visa cards
- ▶ **Mechanized the attack and showed it is effective and easy to carry out**
  - ▶ Bypassed the PIN for a transaction of over **USD 400** with a Maestro card
- ▶ **Disclosed issues to vendor and proposed verified fixes**
  - ▶ Disclosure process led to Mastercard deploy countermeasures at network level

# Outline

1. Introduction
2. Attack and countermeasures
3. Conclusion

# Analysis results for EMV with AID-based routing

Basin et al. "The EMV Standard: Break, Fix, Verify." IEEE S&P 2021

| Target Model                   | exec. | issuer<br>accepts | auth. to<br>terminal | auth. to<br>issuer |

✓: property verified   ✗: property falsified   —: not applicable

- Attacker induces **disagreement** on the card brand: issuer knows the card is a Mastercard but terminal thinks it's a Visa

# Weaponizing: PIN bypass attack

Man-in-the-middle attack built on top of a **relay attack** architecture:

# Weaponizing: PIN bypass attack

Man-in-the-middle attack built on top of a **relay attack** architecture:

1. Terminal sends SELECT command

# Weaponizing: PIN bypass attack

Man-in-the-middle attack built on top of a **relay attack** architecture:

1. Terminal sends SELECT command
2. Card responds with I AM A MASTERCARD

# Weaponizing: PIN bypass attack

Man-in-the-middle attack built on top of a **relay attack** architecture:

1. Terminal sends SELECT command
2. Card responds with I AM A MASTERCARD
3. Attacker replaces response with I AM A VISA

# Weaponizing: PIN bypass attack

Man-in-the-middle attack built on top of a **relay attack** architecture:

1. Terminal sends SELECT command
2. Card responds with I AM A MASTERCARD
3. Attacker replaces response with I AM A VISA
4. Transaction continues in two simultaneous sessions:
  - ▶ Terminal & Attacker running the Visa protocol
  - ▶ Attacker & Card running the Mastercard protocol

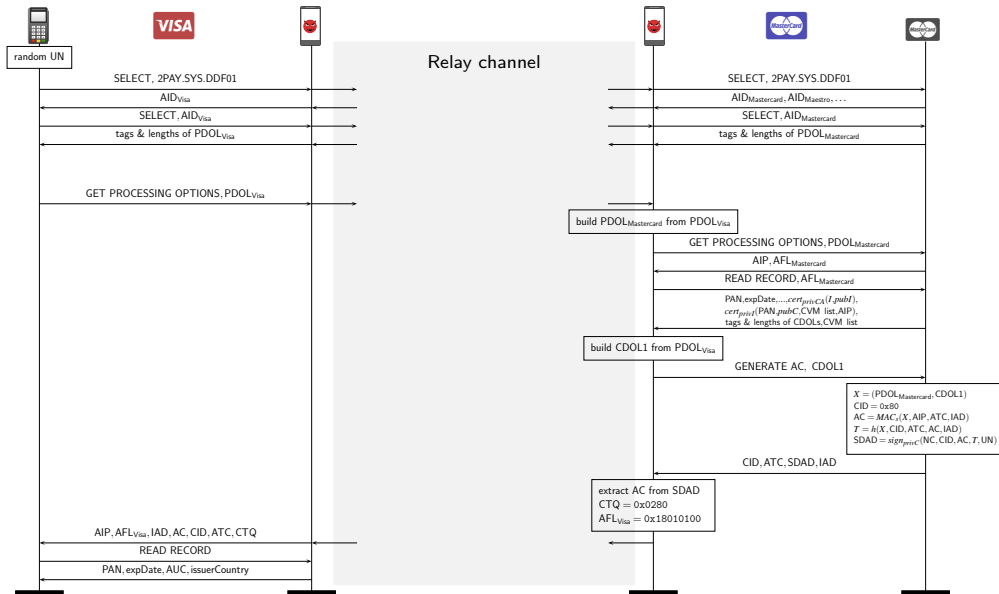

# Weaponizing: PIN bypass attack

Man-in-the-middle attack built on top of a **relay attack** architecture:

1. Terminal sends SELECT command
2. Card responds with I AM A MASTERCARD
3. Attacker replaces response with I AM A VISA
4. Transaction continues in two simultaneous sessions:
  - ▶ Terminal & Attacker running the Visa protocol
  - ▶ Attacker & Card running the Mastercard protocol
5. Attacker applies PIN bypass on Visa [see our S&P paper]

# The attack in technical detail

# Demo

Available at:

- ▶ <https://youtu.be/8d7UgIiMRBU>
- ▶ <https://emvrace.github.io>

# Countermeasures

- ▶ We verified that our countermeasure<sup>1</sup> to the PIN bypass on Visa **does prevent** our Mastercard-Visa brand mixup

---

<sup>1</sup>Basin et al. “*The EMV Standard: Break, Fix, Verify.*” IEEE S&P 2021

# Countermeasures

- ▶ We verified that our countermeasure<sup>1</sup> to the PIN bypass on Visa **does prevent** our Mastercard-Visa brand mixup
- ▶ We also proposed and machine-checked new **intra-kernel countermeasures**

---

<sup>1</sup>Basin et al. “*The EMV Standard: Break, Fix, Verify.*” IEEE S&P 2021

# Countermeasures

- ▶ We verified that our countermeasure<sup>1</sup> to the PIN bypass on Visa **does prevent** our Mastercard-Visa brand mixup
- ▶ We also proposed and machine-checked new **intra-kernel countermeasures**
- ▶ Mastercard implemented their own defenses at **network level**, which we experimentally confirmed as effective against our attack

---

<sup>1</sup>Basin et al. “*The EMV Standard: Break, Fix, Verify.*” IEEE S&P 2021

# Outline

1. Introduction
2. Attack and countermeasures
3. Conclusion

# Conclusion

- ▶ **Systems must be verified as a whole and not by parts separately**  
Separate system parts may be secure but composition may be insecure
- ▶ **Ambiguity and redundancy should be avoided in system specification**  
Critical mechanisms (e.g. routing) of the system should be unambiguously specified
- ▶ **Formal automated verification is a necessity**  
We (humans) cannot cover the full execution space that complex systems have
